INDUCTIVE LOOP DETECTOR

1. Introduction

The FLUX SA is a single channel stand-alone inductive loop detector designed for vehicle access applications.

The detector is responsive, highly sensitive, and utilises sophisticated software algorithms which adapt to prevent false triggering due to changing environmental conditions. Easy to use dipswitches, as well as visual and audible feedback of loop operation, ensure a hassle-free installation experience.

Typical uses include free-exit loops, safety loops, closing loops for traffic barriers, arming loops for access control equipment, and general vehicle sensing applications.

IMPORTANT Π Safety Instructions

- 1. All installation, repair, and service work to this product must be carried out by a suitably qualified person.
- 2. Do not in any way modify the components of the system.
- 3. Do not install this product near sensitive electrical components (e.g. the DOSS sensor inside the gate operator housing).
- 4. Do not install the equipment in an explosive atmosphere: The presence of flammable gas or fumes is a serious danger to safety.
- 5. Before attempting any work on the system, cut electrical power and disconnect the batteries.
- 6. Do not leave packing materials (plastic, polystyrene, etc.) within reach of children, as such materials are potential sources of danger.
- 7. Dispose of all waste products like packaging materials, etc., according to local regulations.
- 8. CentSys does not accept any liability caused by improper use of the product, or for use other than that for which the system was intended.
- 9. This product was designed and built strictly for the use indicated in this documentation. Any other use, not expressly indicated here, could compromise the service life/operation of the product and/or be a source of danger.
- 10. Anything not expressly specified in these instructions is not permitted.

2. Product identification

- 1. Connectors
- 2. FLUX SA housing
- 3. Bootloader header
- Reset button
- 5. Diagnostic LEDs
- 6. Dipswitches
- 7. Dipswitch cover

This green LED Indicator is illuminated when there is a vehicle detected. This LED can also be used to determine the loop frequency. Reset or power up, Detect **Indicator LED** count the number of times the Detect LED flashes. Multiply this number by 10KHz. For example: if the LED flashes eight times, then the loop frequency is approximately 80KHz

5. Relay Functionality

| | Vehicle detected | No vehicle detected | Loop faulty | Power off |
|-----|---------------------|------------------------|-------------|-----------|
| N/O | Closed | Open | Closed | Closed |
| N/C | Open | Closed | Open | Open |

6. Tips for a Successful Loop Installation

- 1. The FLUX SA should be installed in a weatherproof location, such as the inside of a gate operator, as close to the loop as possible.
- 2. The loop and feeder should be constructed from XLPE (crosslinked polyethylene) insulated multi-stranded copper wire with a minimum cross-sectional area of 1.5mm². The feeder should be twisted at a rate of at least 20 turns per metre to improve reliability (Remember that twisting the feeder will shorten its length, so ensure a long enough feeder wire is used). Feeders which may pick up electrical noise should use screened cable, with the screen earthed at the detector.
- Joints in the wire are not recommended, but where required must be soldered and made waterproof.

Faulty joints will lead to unreliable operation.

- 4. The loop should be either square or rectangular in shape with a minimum distance of 1m between opposite sides.
- 5. Two to six turns of wire are typically used in the loop see table helow.

| Loop perimeter (metres) | Number of turns |
|-------------------------|-----------------|
| 3 - 4 | 6 |
| 4 - 6 | 5 |
| 6 - 10 | 4 |
| 10 - 20 | 3 |
| >20 | 2 |

- 6. When two loops are laid in close proximity to each other, it is recommended that different numbers of turns are used in each loop to prevent cross-talk.
- 7. Cross-talk describes the interference between two adjacent loops. and can cause reliability issues.

To minimize cross-talk, adjacent loops should be at least two metres apart, and on different frequency settings

The most reliable form of loop is preformed and enclosed in conduit. This prevents water ingress, and minimizes the effects of vibration

9. Where a pre-formed loop is not practical, slots should be cut into the road using a masonry cutting tool. A 45° cut should be made across the corners to prevent damage to the wire on the corners. The slot should be about 4mm wide and 30mm to 50mm deep. Remember to extend the slot from one of the corners to the roadside to accommodate the feeder. After the loop and feeder wires have been placed in the slot, the slot must be filled with an epoxy compound or bitumen filler.

7. Mounting instructions

The housing of the **FLUX SA** is not weatherproof, and it should not be mounted externally.

Rather mount the **FLUX SA** inside an operator or suitably protected control box. Mounting points have been incorporated into the design of the cover of the FLUX SA to assist you in obtaining the optimal position.

8. Electrical setup

- 1. Ensure that all low voltage systems (less than 42.4V) are suitably protected from damage, by disconnecting all sources of power such as chargers and batteries before doing any work. **#**
 - All electrical work must be carried out according to the requirements of all applicable local electrical codes.(It is recommended that a licensed electrical contractor perform such work.)

8A. D5-Evo Free-exit Loop

8B. D5-Evo Closing Safety Loop

8C. Generic Connection Diagram

9. Commissioning the System

- 1. With the loop connected, apply power to the FLUX SA.
- 2. The red Power LED will light up, and the green Detect LED will flash until the loop has stabilized, and then turn off.
- 3. If the buzzer is enabled, it will sound continuously during this period.
- 4. Once the loop has stabilized, only the red Power LED should be on.
- 5. Bring a metal object towards the loop, and the Sense level LEDs will begin to light up, indicating the detection range of the loop.
- 6. Once all five lights have lit up, the unit will enter detect, with the green Detect | FD lit.
- 7. If the buzzer is enabled, a variable tone will indicate the sense level, and change to a continuous tone once the unit has detected.
- 8. Configure the desired operational settings using the Dipswitches (open the access flap to access the Dipswitches).
- 9. Test the FLUX SA using a metallic object, or a vehicle.

10. Diagnostics

| Symptom | | Possible cause | Solution |
|--|-------------------------|--|---|
| The power LED is not on | | No power supply voltage on the input. | Check that the power supply is correctly wired to the detector. |
| The sense Le | , vol | There may be a poor connection in the loop or loop feeder. | Check all wiring. Tighten screw terminals. Check for broken wires. |
| LEDs flash erratically | | The detector may be experiencing crosstalk with the loop of an adjacent detector. | Try changing frequencies using the frequency switch. Put the detector with the larger loop onto low frequency and the detector with the smaller loop onto high frequency. |
| The detector randomly detects, ever | | Faulty loop or loop feeder wiring. | Check the wiring. Tighten screw terminals. Check for pinched or bent wires. Is the feeder wire twisted? |
| though there no vehicle present | is | Movement of the loop in the ground. | Check for cracks in the road surface near the loop. |
| The Loop Fau LED is flashir and an audib tone is heard two short tones, one lo tone | lt Ig, . Ie ng | The loop inductance is too large, or the loop is open circuit. | Check that there is electrical continuity on the loop. If the loop inductance is too large then try reducing the number of turns. |
| The Loop Fau LED is permanently illuminated, and an audib tone is heard one short tor one long tone | lt le e, | The loop inductance is too small, or the loop is short circuited. | Check that there is no short circuit on the loop feeder wiring or the loop. If there is no short circuit then the inductance is too small and more turns of wire should be added to the loop. |
